Wireless Notice Board usin Raspberry Pi

Wireless Notice Board using Raspberry pi - Embeded system, using Raspberry Pi Any institution or public utility location, such as bus terminals, railway stations, colleges, malls, and so on, must have a notice board. However, adhering to different alerts on a basis is a challenging task. A separate person is required to take care of this notices display. The goal of this project is to create an innovative wireless notice board. We can add, or change the text at any moment to meet our needs. For sending alerts, a web-based interface is employed. At receiving end Wi-Fi is connected to raspberry pi. When an authorized user sends a notice from his system, it is received by receiver. The information comes from a verified user. It then transfers the data to the Raspberry Pi. Raspberry pi sends the data to be displayed to a controller which again send the data to primary LED matric after processing it.	Dec 2021 - Present
